

# iPPF: a Radiance based online tool for solar and daylight access studies in urban areas

Raphaël Compagnon

12 October 2004

Ecole d'ingénieurs et d'architectes de Fribourg  
Hochschule für Technik und Architektur Freiburg

# Motivations

- To make our developements available for other users without the burden of writing manuals or solving remote problems.
- To be able to rapidly make changes or add new features to the system.
- To experiment an « integrated » platform that may also serve for future tools.

The developments implemented so far are results from three research projects:

- PRECis: [Assessing the Potential for Renewable Energy in Cities](#), EU project completed in 2000
- SOLURBAN: [Solar Energy Utilisation Potential of an Urban Site](#), Swiss Federal Office of Energy project, nearly at the end
- RUROS: [Rediscovering the Urban Realm and Open Spaces](#), EU project completed in 2004

Underlying calculation method described in:

R. Compagnon, **Solar and daylight availability in the urban fabric**  
Energy and Buildings Volume 36, Issue 4 , April 2004, Pages 321-328

# Existing Web based interfaces to computer tools in the field of solar/daylight simulations

European of Daylight and Solar Radiation:

<http://www.satel-light.com/>

Integration and exploitation of networked solar radiation databases for environment monitoring:

<http://www.soda-is.com/>

Lightswitch Wizard:

<http://www.buildwiz.com/>

Virtual Lighting Simulator:

<http://gaia.lbl.gov/vls/>

Also using  
**RADIANCE** as  
calculation  
engine!

## Stepwise procedure:

- 1) Upload the model
- 2) Select the type of results required (with or without sky models), submit the calculations
- 3) After receiving a mail from the system, look at the results
- 4) Other results required ? Then Iterate from step 2

# Input of buildings

Through textfiles using a simple command line format :

```
defsite ex2 0 0 0 0 0 0 80 80
<ppf_slab A 12 20 10 5 5
<ppf_slab A 9 10 10 25 10
<ppf_dup A 1 40 0 1 0 25
ground
25 20
35 20
35 15
45 15
45 35
25 35
0 0
```

Limitations:

Simple extruded  
block buildings

# Input of buildings

η Through *properly generated* DXF files  
(extruded POLYLINES or 3DFACE objects only)

η Through MID/MIF files generated from Mapinfo or other GIS software

# Input of skies

$\eta$  Through a textfile containing hourly direct normal irradiances, diffuse horizontal irradiance and air temperature (easy to obtain using METEONORM)

**METEONORM Version 4.0**

File Format Site Basic data Plane Horizon Calculations Language Info

**Status**

Site: Fribourg

Situation: open

Horizon: astronomic

Format: Standard

Type: Cities

**Basic data**

Mean val.  Extreme val.

Random  Ghmax

**Calculations**

Monthly val.  Hourly values

Save

**Plane orient.**

Azimuth: 0 Plane orient.

Inclination: 0

**Units**

Radiation (month) [ kWh / m2 ]

Temperature [ °C ]

Units (User defined)

**Preview**

View site View results

**Calculation (monthly val.)**

| Month | H_Gh | H_Dh |
|-------|------|------|
| Jan   | 33   | 22   |
| Feb   | 49   | 31   |
| Mar   | 88   | 51   |
| Apr   | 113  | 66   |
| May   | 148  | 82   |
| Jun   | 158  | 84   |
| Jul   | 179  | 83   |
| Aug   | 151  | 73   |
| Sep   | 106  | 56   |
| Oct   | 62   | 39   |
| Nov   | 33   | 23   |
| Dec   | 27   | 18   |
| Year  | 1144 | 628  |

**Progress**

0%

# Demo

Online version will/should... be made available on the Internet by the end of the year
