Window transmittance

Daylight simulations

Surroundings

+/- 10 to 100%

Virtual model

Physical  
methods

COMPARISON

Building

COMPARISON

Virtual  
methods

– Identification of the main causes of experimental errors.

– Identification of the main causes of numerical errors.

– Comparison of the physical and virtual models with the real building with regard to their accuracy and reliability.

– Establishment of a practical checklist of daylighting models.

Objectives of the Research

## Building

Daylighting test module

Office room

A side-lit window - South

Models were reproduced with real building properties.

Real building

Virtual model

# Real Building and Models

Location: Lausanne,  
Switzerland

Latitude: 46.5°N

Longitude: 6.6°E

Elevation: 396 m

Placement: Concrete platform

Real Building

**Interior Dimensions (m):**

6.5 x 3 x 2.5

**Window Dimensions (m):**

3 x 1.6

Real Building

### **Materials, Reflectance (%)**

North wall : Canvas, 83

East wall : Satin, 82

South wall : Painted metal, 72

West wall : Satin, 82

Ceiling : Satin, 80

Floor : Carpet, 16

### **Window, Transmittance (%)**

Double Glazing, 80

Real Building

- ① Hagner/LMT sensors : outdoor illuminance
- ② Sky scanner : sky luminance distribution

- ③ BEHA sensors : indoor illuminance
- ④ Camera + Luminance meter : surface luminance

Real Building

**Interior Dimensions (m):**

0.65 x 0.30 x 0.25

**Window Dimensions (m):**

0.30 x 0.16

**Materials, Reflectance (%)**

North wall : Paper, 79

East wall : Paper, 79

South wall : Paper, 71

West wall : Paper, 79

Ceiling : Paper, 76

Floor : Paper, 16

**Window, Transmittance (%)**

Single 2mm acrylic + films, 79

1:10 Scale model

**Location 1:**  
In front of  
the adjacent test module

1:10 Scale model

**Location 2:**

On the automated movable  
platform

Under Scanning sky simulator

1:10 Scale model

① PRC Krochmann sensors  
: indoor illuminance

② Scanning sky simulator  
: sky luminance distribution

1:10 Scale model

**Interior Dimensions (m):**

6.5 x 3.0 x 2.5

**Window Dimensions (m):**

3.0 x 1.6

Virtual model

Virtual model

**Reflectance (%)**

North wall : 82

East wall : 81

South wall : 72

West wall : 82

Ceiling : 80

Floor : 16

**Transmittance (%)**

80

Virtual model

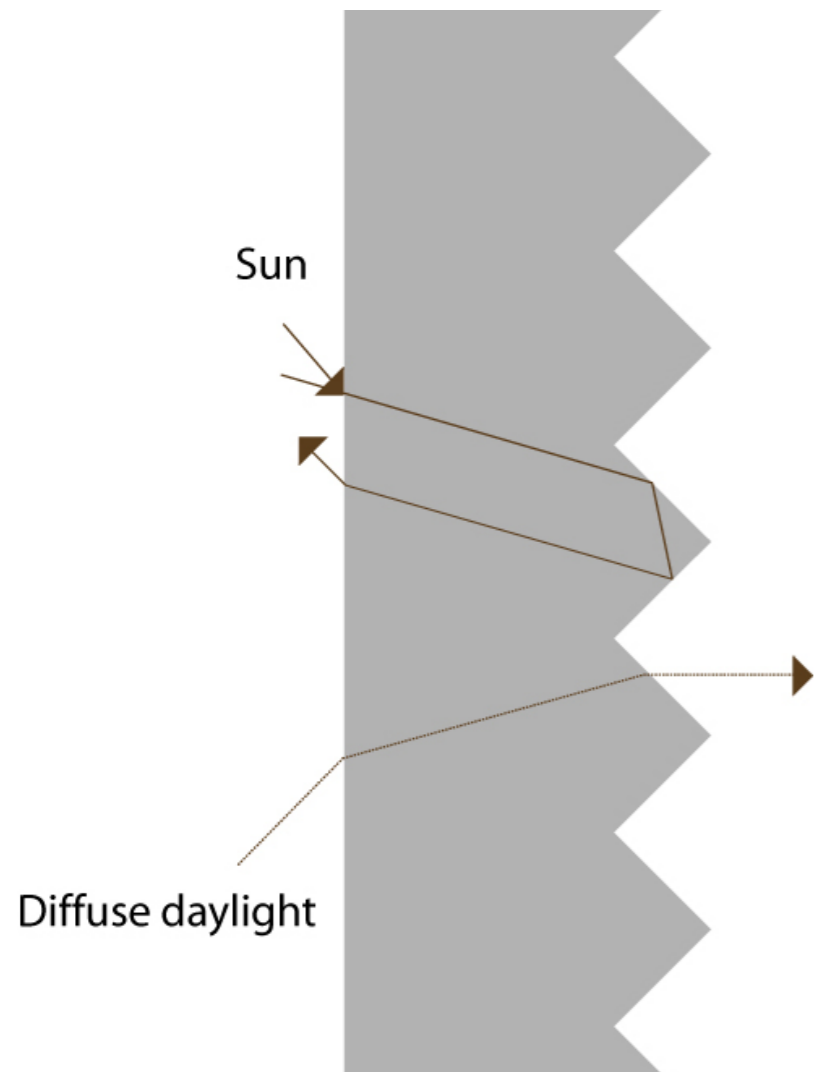

Daylight redirecting system  
 6 mm acrylic panel with laser cuts at 4 mm intervals  
 Laser cut surfaces perform as small mirrors.  
 Upper part of the window redirects daylight  
 towards the ceiling

# Complex Fenestration Systems (CFS)

Daylight redirecting system  
Acrylic or Polycarbonate

Upper part of the window redirects daylight towards the ceiling

## **Sensitivity study**

- Set 1 : Window dimension**
- Set 2 : Model dimension**
- Set 3 : Model details**
- Set 4 : Surface photometry**
- Set 5 : Ground photometry**
- Set 6 : Window photometry**
- Set 7 : Sensor's sensitive area**
- Set 8, 9 : Sensor placement**
- Set 10, 11 : Sensor positioning**

### Simulation parameters

**ab = 9**  
**aa = 0.1**  
**ad = 26315**  
**ar = 128**

**CIE standard sky**  
**(Gensky)**  
– **Overcast sky**  
– **Clear sky (16CEST)**

**Set 1 : Window dimensions**

**Set 2 : Model dimensions**

# Prismatic Film

Overcast sky

Relative errors (%)

Depth errors (m)

Measured points

- + 6.2 m from window
- o 3.2 m from window
- 0.2 m from window

## Set 2 : Model dimensions

**Base case**

**No lighting fixtures**

**Base case**

**Only window frame**

**Without window frame**

**Set 3 : Model details**

## Overcast sky

## Clear sky

Relative errors  
(%)

Fenestration  
systems

## Set 3 : Model details

Errors in model critical details result in greater divergences under overcast sky conditions, particularly with CFS

### Surface reflectance Case study

Overestimation

Base case  
Real building  
reflectance

Underestimation

## Set 4 : Surface Reflectance

### Window transmittance Case study

Overestimation

Base case  
Real building  
Transmittance

Underestimation

## Set 6 : Window Transmittance

# Laser Cut Panel

Only 10% over-estimation of surface reflectance leads to more than 40% divergence

Clear sky

+ 6.2  
○ 3.2  
□ 0.2

Measured points

+ 6.2 m from window  
○ 3.2 m from window  
□ 0.2 m from window

↑  
Relative errors (%)

↑  
Over-estimation (%)

## Set 4 : Surface Reflectance ( Over-estimation)

# Laser Cut Panel

Less than 30% error in window transmittance can lead to 30% divergence

Overcast sky

Relative errors (%)

Transmittance errors (%)

Measured points

- + 6.2 m from window
- o 3.2 m from window
- 0.2 m from window

## Set 6 : Window Transmittance

# Main causes of errors in daylighting performance assessment

## Modelling

- Geometric properties
- Photometric properties
- Photometric sensors
- CFS modelling

## Sky luminance values

- Sky luminance distribution

## Daylight simulation

- Division of sky
- Sky type
- Sky luminance acquisition using sky scanner

## Application

**Source of error**                      **Accuracy required from daylighting performance assessment**

	<b>Accurate study model</b>		<b>Moderate study model</b>		<b>Pilot study model</b>	
	Modelling Precision	Possible Relative error	Modelling Precision	Possible Relative error	Modelling Precision	Possible Relative error
<b>Surface reflectance</b>	+10%	<100%	+20%	<200%	>+20%	>200%
<b>Glazing transmittance</b>	+10%	<100%	+20%	<200%	>+20%	>200%
<b>Daylight simulation</b>	Real sky	-	Continuous sky	<50%	145 sky sectors	up to 250%

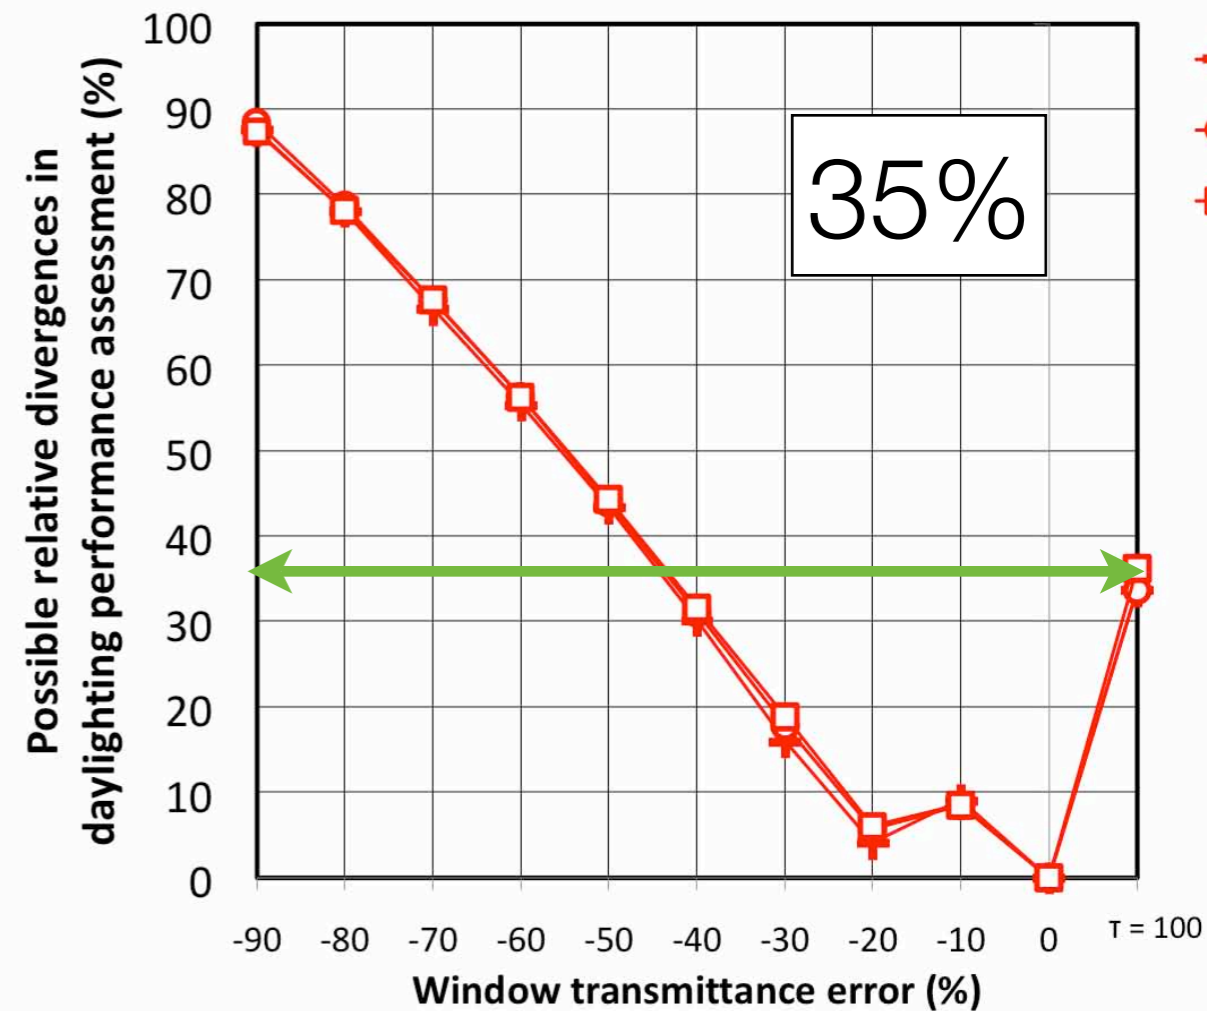

**Checklist**

Measured points

- + 6.2 m from window
- 3.2 m from window
- 0.2 m from window

Inaccuracy estimation  
Set 6 : Window Transmittance

# Conclusion

---

- **Accurate** model properties, particularly the **photometric properties** are **key factors** in daylighting performance assessment  
**10% over-estimation -> 100% relative divergence**
- Better understanding of the sources of errors -> better construction/fabrication of the physical model -> better predictions  
**error can be reduced by up to 200%**
- Daylighting model checklist: To **minimize** the errors in the model
- Daylighting model charts: To **estimate** the errors in the assessment
