PSORT(1) PSORT(1)

### **NAME**

psort - sort primitives in metafile as requested

# **SYNOPSIS**

# **DESCRIPTION**

*Psort* reads each metafile *file* in sequence and sorts primitives between globals according to the option specification. Lower case options mean the corresponding minimum, upper case indicates the maximum value. A '+' before the option means sort in order of increasing values, '-' means decreasing. The order the options appear on the command line is the order in which the extrema are examined. For example, the options -Y + x would mean "sort on decreasing ymax, then increasing xmin values".

If no input files are specified, the standard input is read.

# **EXAMPLE**

To sort the file "meta" in order of increasing xmax, then decreasing ymin:

### **FILES**

/tmp/psXXXXa /tmp/psXXXXb

#### **BUGS**

Aborting the program will sometimes leave files in /tmp.
